

**Market Highlights**

There were definite headwinds for the US and Canadian economies when Q1 began, but we were relatively optimistic that the US consumer would shift into a higher gear on the back of consistent employment gains and a petrol dividend to drive US growth, with collateral benefit to the slowing, energy-sensitive, Canadian economy. However, weather is always a wild card for the economy, and this year's winter was again severe (although, after last year's winter, it is easy to see how one could have ignored the small probability of a repeat). It will take some time and more bad winter weather, before seasonal adjustments reflect more dramatic seasonal patterns. At any rate, the detrimental impact of weather on consumers and growth during the quarter is gradually becoming clearer, suggesting that we will have to wait another quarter to see the full impact of healthier US consumer finances.

In Canada, tough winter conditions only added to the fallout from the beleaguered energy sector and the confidence-deflating ministrations of Governor Poloz, who recently described the Canadian economy as "atrocious" to a Financial Times correspondent during an interview. Economic data was decidedly negative, with the bright spots mostly coming from currency sensitive manufacturing exports and interest rate sensitive consumer spending. Although, in the case of consumer spending, further increases to consumer debt levels continue to be a concern for the Canadian economy, although evidently not for the Bank of Canada at this time.

During the quarter Janet Yellen continued a fairly predictable message of eventual rate increases within a framework of data dependency while attempting to mitigate volatility, albeit unsuccessfully, to the overall yield curve. In that context, 2-year US yields dropped from 0.67% to 0.58%, and 5-year US yields dropped from 1.65% to 1.37% while bouncing between 1.15% and 1.69% during the quarter. In contrast, the Bank of Canada was mostly unpredictable, surprising investors first with a rate cut in January and then with indications of more to come, no more to come and finally maybe more to come. 2-Year and 5-year Canadian yields fell from 1.01% to 0.51% and from 1.34% to 0.76% respectively.

With bond yields at historically low levels, corporations continued their penchant for new issues, causing first quarter financing totals to eclipse last year's record numbers: \$26.1 CAD billion versus \$21.6 CAD billion in the Canadian market. And the thirst for product from investors seems bottomless, with the raft of new issuance having only a marginal impact on yield spreads.

**Portfolio Activity**

Post the Bank of Canada rate cut and resulting rally of short-term yields the portfolio was positioned for yield curve steepening

further out the curve through a shift into four and five year bonds and reduction of lower-yielding short-term bonds. The portfolio also opportunistically increased exposure (on a duration weighted basis) to senior bank and media bonds which had cheapened on the back of supply.

**What Worked In The Quarter**

Relative to the index, the portfolio was significantly overweight provincial and corporates on a market value weighted basis providing yield enhancement. Additionally, the portfolio's overweight in Quebec provincial credit was positive with Quebec spreads outperforming over ¾ of its peers (among the top performers in the index) due its improving fiscal backdrop and reduced issuance requirements. Finally, although the overall duration of the portfolio was relatively short, the portfolio did benefit from a significant overweight in the best performing – 3 and 4-year area – of the short end of the yield curve.

**What Didn't Work In The Quarter**

The portfolio was structured with a bias to yield curve steepening a concentration in the 3-year area of the yield curve in lieu of maturities closer to 5-years. While the curve did steepen, yields for 1, 2, 3 and 5 year Canada's fell by 43, 50, 67, and 63 basis points respectively.

**Outlook & Strategy**

Although recent US economic data has soured, we fully expect a rebound in Q2 that will continue along the path of strong employment growth. We expect the Fed to continue to downplay its plans, but are still confident in our expectations for a rate increase late in Q2. The most recent Fed "dot plots" suggest a shallower path for short term rates, but we expect the whole US yield curve to gradually move upwards, albeit with a flattening bias. Of course, the extremely low level of yields in other developed countries will continue to exert downward pressure on US yields.

Canada's current economic outlook is not particularly bright, but perhaps not as bad as Governor Poloz sees it. It has been difficult to interpret the Bank of Canada under Poloz, so we are not all that comfortable predicting the Bank's next action. That being said, we are confident that any rate increase is very much into the future. We still expect the Canadian yield curve to steepen with the rise in longer-term US yields, although with a relatively shallow trajectory. We feel it appropriate to have a duration in-line with the short-term benchmark given our outlook and the benchmark's reasonable 2.75 years duration.

Given the easiness of monetary policy globally, capital should continue to remain liquid and thus generally supportive of the corporate bond market. Also, US economic improvement should have a steadying effect on spreads.
